CAS INDEXING IS AVAILABLE FOR THIS PATENT.  
AB The present invention relates to a difructose anhydride (DFA)-containing  
composition and use thereof. DFA is a cyclic disaccharide in which the  
reducing termini of two fructose molecules bind each other to hydroxyl  
groups at the other nonreducing termini. According to the present invention,  
it has been revealed that DFA is effective in accelerating the absorption of  
magnesium, zinc or copper, accelerating bone formation, accelerating  
diuretic action, and improving bowel movement and is useful in inhibiting  
dental caries. A composition of the present invention can be used as a  
composition for a medicinal product and a food or drink product (including  
feed for animal use). Examples of a medicinal product and a food or drink  
product for human or animal use include formulated powder milk, parenteral  
nutrients, health food and drink products, and additives for feed and are  
not particularly limited as long as they are ultimately in an orally  
administrable form.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A composition having a high content of an inorganic material comprising

(1) a granular or powdery phenol-aldehyde resin which is a condensation product of a phenol, an aldehyde and optionally a nitrogen-containing compound having at least two active hydrogens and is characterized by (A) containing spherical primary particles and their secondary agglomerated particles each having a particle diameter of 0.1 to 150 microns, (B) having such a size that at least 50% by weight thereof can pass through a 100 Tyler mesh sieve, and (C) having a free phenol content, determined by liquid chromatography, of not more than 500 ppm, and

(2) a powder of an inorganic material,

the amount of the phenol-aldehyde resin being less than 11% by weight based on the total weight of the phenol-aldehyde resin (1) and the powdery inorganic material (2).

AB The present invention is an orally administered pharmaceutical composition that provides for the controlled release of magnesium. The composition has an interactive agent component and a magnesium component which has an enteric coating that controls the release of the magnesium until the composition is in the small intestine or colon. The other component is released in the stomach and is substantially absorbed prior to the release of the magnesium component. Normally, the interactive agent component decreases the absorption of magnesium when the two components are released simultaneously in the gastrointestinal tract.

AB (Aim)

This invention relates to a powder which is surface-treated by a novel silicone compound, and to a makeup containing this powder. In particular, it relates to a silicone compound which has good compatibility with oils such as ester oils and triglycerides or silicone oils, and to a makeup with a smooth feel, excellent dispersibility and excellent emulsification stability.

[Composition]

A silicone compound represented by the general formula (1):

R.sup.1.sub.aR.sup.2.sub.bR.sup.3.sub.cSiO.sub.(4-a-b-c)/2

(in the formula, R.sup.1 is at least one organic group chosen from alkyl having 1-30 carbon atoms, aryl, aralkyl, fluorine-substituted alkyl or organopolysiloxanylalkyl, R.sup.2 is a reactive substituent group chosen from hydrogen, hydroxy or alkoxy having 1-6 carbon atoms, or a reactive substituent group in which at least one of carbon, oxygen and silicon are bonded to these reactive substituent groups, R.sup.3 is a carboxylate residue represented by the following general formula (2):

R.sup.4CO.sub.2--Q--

R.sup.4 is a saturated or unsaturated hydrocarbon group having 2-30 carbon atoms, Q is a bivalent hydrocarbon group which may also contain a hetero atom, a is 1.0-2.5, b is 0.001-1.5, and c is 0.001-1.5, a powder surface-treated with this silicone compound, and a makeup containing this powder.

AB A cosmetic material in which a silicone compound represented by the following formula (1) is mixed:

R.sup.1.sub.aR.sup.2.sub.bSiO.sub.(4-a-b)/2 (1)

wherein R.sup.1 groups, which are the same or different, each represent a hydrogen atom or an organic group selected from the class consisting of alkyl groups containing 1 to 30 carbon atoms, aryl groups, aralkyl groups, fluorinated alkyl groups and organic groups represented by the following formula (2); R.sup.2 groups each represent a silicone group represented by the following formula (3); a is a number of from 1.0 to 2.5; b is a number of from 0.001 to 1.5;

--C.sub.cH.sub.2c--O--(C.sub.2H.sub.4O).sub.d(C.sub.3H.sub.6O).sub.eR.sup.3.p.3 (2)

##STR1##

wherein R.sup.3 is a hydrocarbon group containing 4 to 30 carbon atoms, or an organic group represented by R.sup.4--(CO)--; R.sup.4 is a hydrocarbon group containing 1 to 30 carbon atoms; c is an integer of from 0 to 15, d is an integer of from 0 to 50, and e is an integer of from 0 to 500. The silicone compounds represented by formula (1) not only have high compatibility with other ingredients of cosmetics, such as oils, surfactants and powders, to ensure high stability in the emulsified state, but also they produce an excellent effect in cleansing sebum stains and durable makeup stains.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB This invention relates to a silicone polymer which is insoluble in organic solvents because it has a three-dimensional crosslinked structure which swells up relative to fluorosilicone oils, to a paste-like composition formed by making the silicone compounds swell up in silicone oil, and to a cosmetic material.

It is therefore an object of this invention to provide a silicone polymer having a fluorine modified oil with excellent water repellence and oil repellence as base oil, and which swells up relative to these oils, to a homogeneous paste-like composition using this silicone polymer, and to a cosmetic material comprising this composition.

This invention is a silicone polymer having a three-dimensional crosslinked structure obtained by polymerizing at least one of an organohydrogen polysiloxane (A1) represented by the general formula (A1):

R.sup.1.sub.aR.sup.2.sub.bH.sub.cSiO.sub.(4-a-b-c)/2 (A1)

at least one of a polyoxyalkylene (B1) represented by the following general formula (B1):

C.sub.fH.sub.2f-1O(C.sub.gH.sub.2gO).sub.hC.sub.fH.sub.2f-1 (B1)

and an organopolyoxyalkylene (B4) represented by the following general formula (B4):

R.sup.1.sub.aR.sup.3.sub.bSiO.sub.(4-j-k)/2 (B4)

this polymer being insoluble in organic solvents, and which can contain its own weight or more of pentane-3,1,3-trifluoropropyl pentamethylcyclotetrasiloxane.

This invention is also a paste-like silicone composition, which is represented by the general formula (C):

R.sup.1.sub.aSiO.sub.(4-m)/2 (C)

and which is obtained by kneading a mixture of 100 weight parts of the above silicone polymer with 10-1000 weight parts of a fluorine-modified silicone oil having a viscosity at 25 degree C. of 200 mm.sup.2/s.

AB A modified silicone compound having a branch polymer comprising a hydrophilic group, this compound being synthesized by performing an addition reaction between an organohydrogenpolysiloxane, and at least one compound chosen from an alkenylated polyoxyalkenylated compound, an alkenylated glycerine compound and an alkenylated sugar in the presence of a platinum catalyst or rhodium catalyst, and a cosmetic material containing this modified silicone compound. This compound is purified by decomposing aldehyde condensation products remaining in the silicone by alkylating the remaining unsaturated bonds after hydrogenating the reaction liquor after said addition reaction, and treating with an aqueous solution of pH 7 or lower containing an acidic substance, or decomposing the propenyl etherated polyether in the reaction liquor after said addition reaction by treating with an aqueous solution of pH 7 or lower containing an acidic substance, and then alkylating the generated aldehydes and alkenylated ether compounds by hydrogenation. The degree of unsaturation (meq/g) in the modified silicone compound is 0.002 or less. The generation amount of aldehydes when heat ageing is performed in 0.23N hydrochloric acid at 50° C. for 0.5 hours is 70 ppm or less of the modified silicone compound.

AB This invention relates to a novel polyhydric alcohol-modified silicone, and to cosmetic products containing the same. When the polyhydric alcohol-modified silicone was used as an oil base, the cosmetic containing it had excellent adhesion to the skin without being sticky and had a clean feel, and when it was used as an emulsifying agent, it had excellent emulsification stability.

It was found that when this polyhydric alcohol-modified silicone represented by the general formula (I) below, and obtained by the addition reaction of a polyhydric alcohol-substituted hydrocarbon group, a silicone compound and an organohydrogen polysiloxane, was used as an oil base or an emulsifying agent, it had very high affinity with silicone oil bases and excellent emulsifying power, and the stability of the emulsion obtained was very good.

Further, it is excellent in natural luster-imparting effect and storage stability.
